

# How to assess higher order thinking skills: theory and practice

Caroline Jongkamp  
Nico Dieteren  
January 2021

# Topics

1. Higher Order Thinking Skills
2. Assessment in contexts
3. Ways to categorise e-assessment item types
  - by type
  - by assessment objective
4. Q&A

# HOTS and eAssessment: how we started

- 2015 Innove Estonia Workshop eAssessment
- 2016 IAEA Cape Town: paper presentation
- 2017 IAEA Batumi: pre-conference workshop
- 2018 AEA-E Arnhem-Nijmegen: pre-conference workshop\*
- 2019 IB workshop for examiners\*
- 2019 AEA-E Lisbon: pre-conference workshop\*
- *2020 IAEA Accra: paper presentation: planned\**

\* Caroline with Rebecca Hamer (IBO)

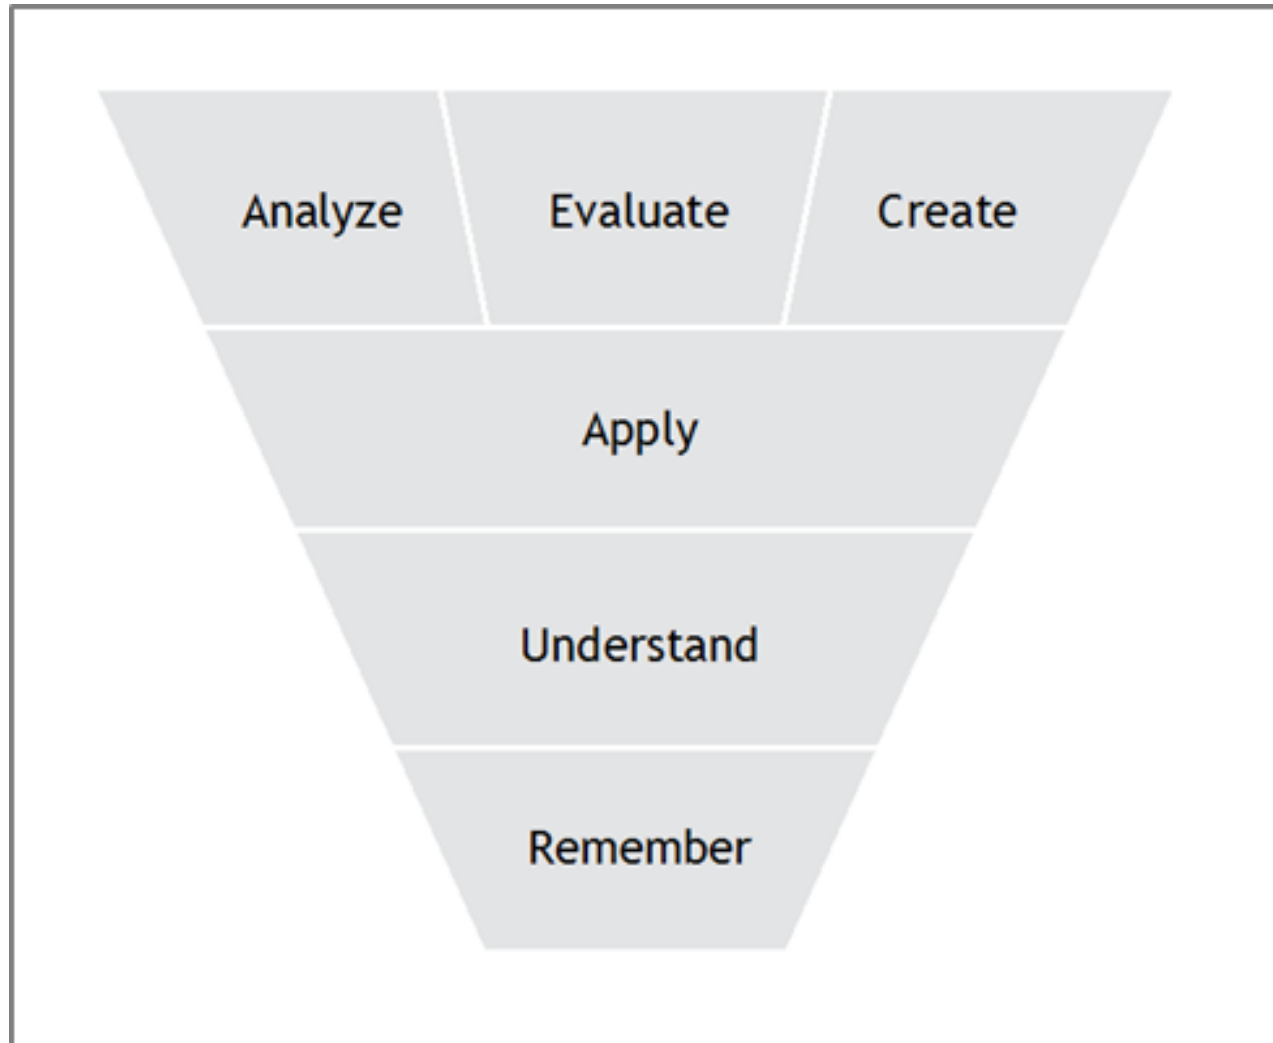

# Higher Order Thinkings Skills (HOTS)

- Higher order thinking skills in high stakes testing: how to develop valid and reliable assessment instruments in 21st century contexts?
- Examples from
  - Final exams the Netherlands (source: CvTE & Cito), from
  - PISA (source: OECD) and exams from IB

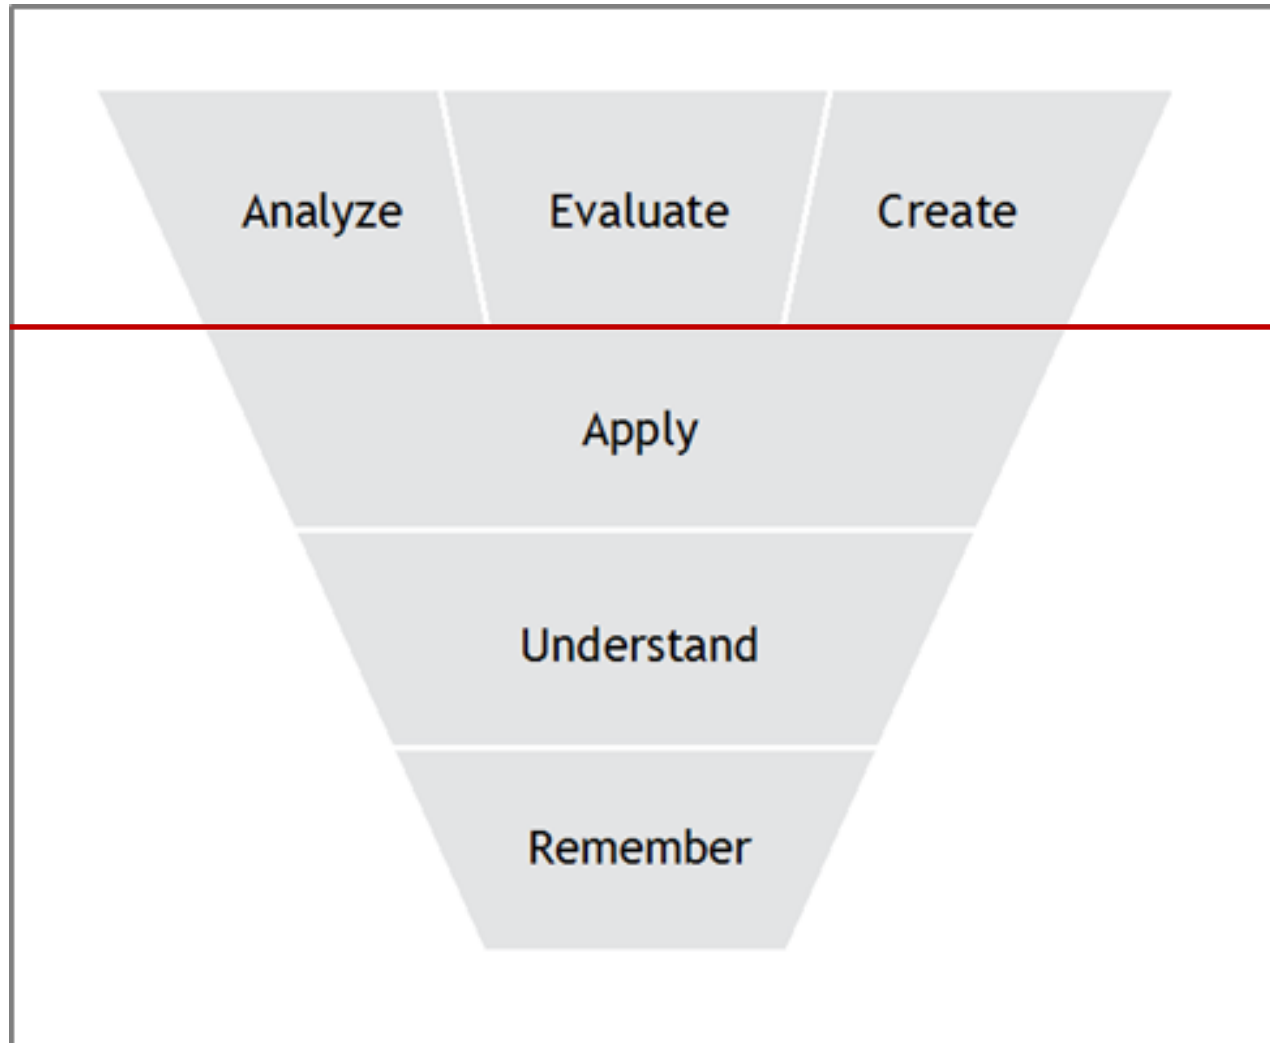

# Shifting goals of education

- “The meaning of knowing has shifted from being able to remember and reproduce information, to being able to find, select, judge and use information”  
(free after Herbert Simon)
- “Students should be prepared for life skills in 21st Century contexts: more application, analysis, evaluation, creation” (OECD, PISA frameworks)

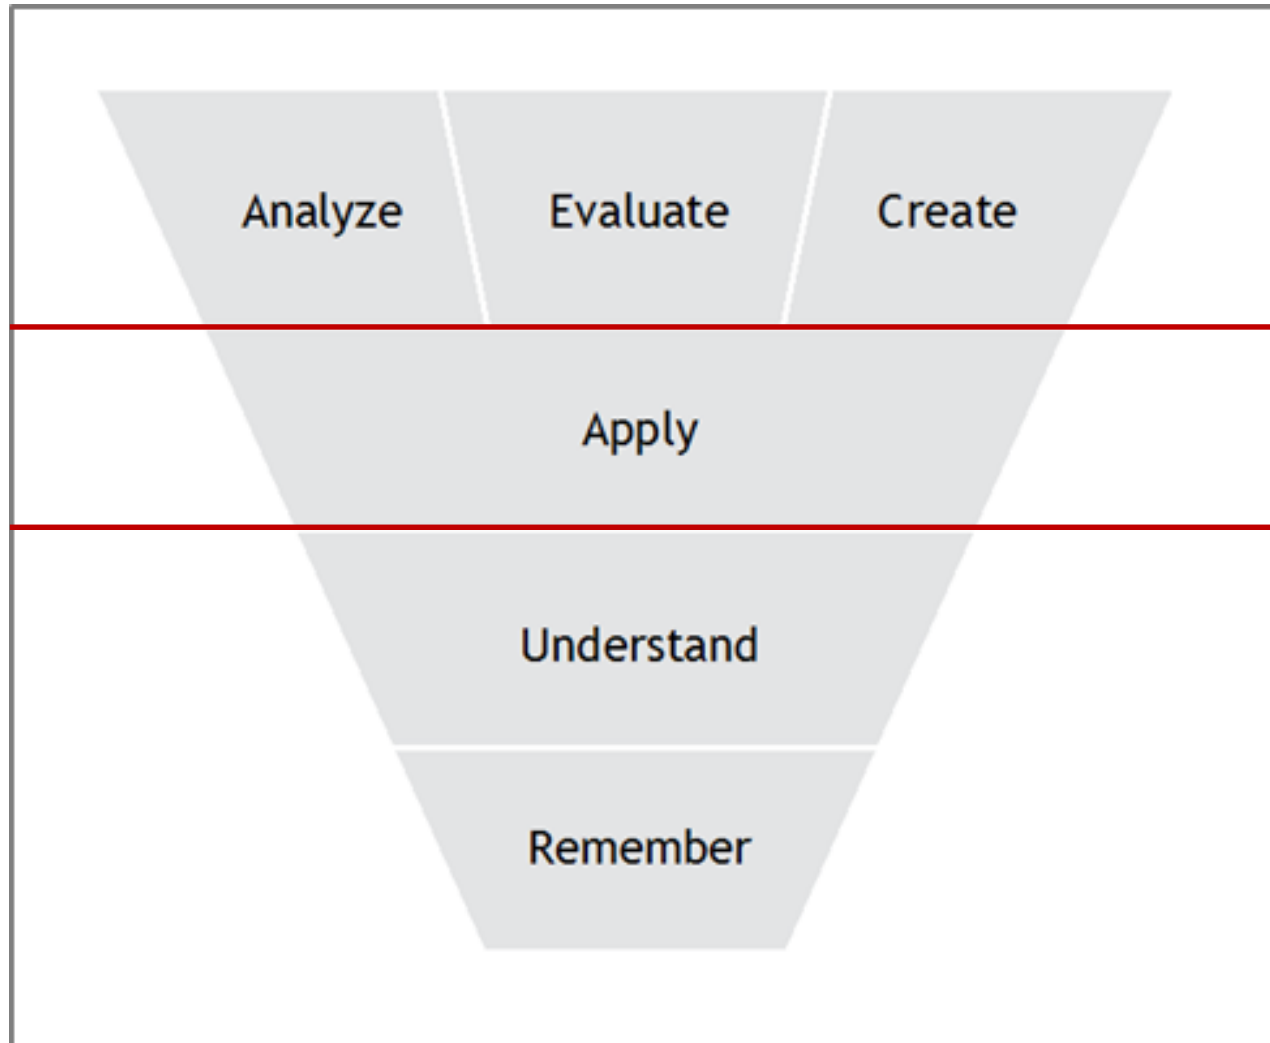

# HOTS in a taxonomy : what is high?

# HOTS in a taxonomy : what is high?

# HOTS in a taxonomy : what is high?

# HOTS : our definition

“Higher order thinking occurs when a person takes **new** information and information **stored in memory** and **interrelates** and/or rearranges and extends this information **to achieve** a purpose or find answers in perplexing **situations**.  
(Lewis, A., & Smith, D.C., 1993)

→ situations → contexts → assessment in contexts

# Assessment in contexts

- Assessing knowledge and skills in real world contexts
- Depending on the format of assessment – paper, computer, simulator, practice – contexts will be more or less modeled

# Example 1: mathematics – open question – paper based

## High and low tide

Rijkswaterstaat publishes tide predictions for a number of places along the Dutch coast. These are calculated using a mathematical model based on measurements over a long period of time. Figure 1 gives the expected water level on 14 November 2012 for Schiermonnikoog.

figure 1

The values in the graph of figure 1 can be approximated by the formula  $w = 4 + 128 \sin(0.51(t + 5.4))$ . Here,  $w$  is the water level in cm and  $t$  is the time in hours with  $t = 0$  at 00:00. The moment of highest water level in the evening according to the formula differs from that moment in the graph in figure 1.

4p 17 Determine this difference in minutes.

# Example 1 : marking scheme

## Maximum score 4

- high tide occurs at 22:40 1
- $t \approx 2$  Calculated the correct maximum of the graph at  $t \approx 22.3$  1
- Read the graph correctly: 2.3 corresponds to 22:18 or 22:19 1
- The difference is 21 or 22 (minutes) 1

## *Note*

*A margin of 10 minutes is allowed for the time of high tide.*

# Example 2: geography - closed and computer based

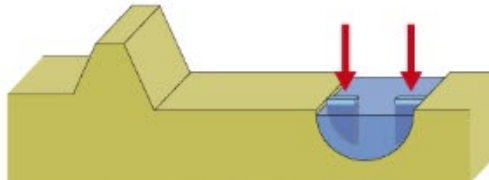

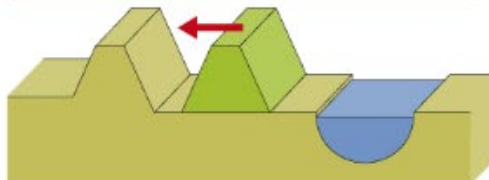

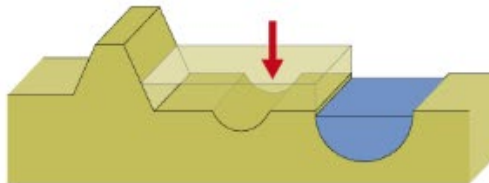

Vraag 23 van 45  
1p

Room for the river

The images represent measures that correspond with the “Room for the river” project.

Which measure applies to Deventer, according to the information in the video?

# Example 4: science – use of simulations – computer based

PISA 2015

## Running in Hot Weather

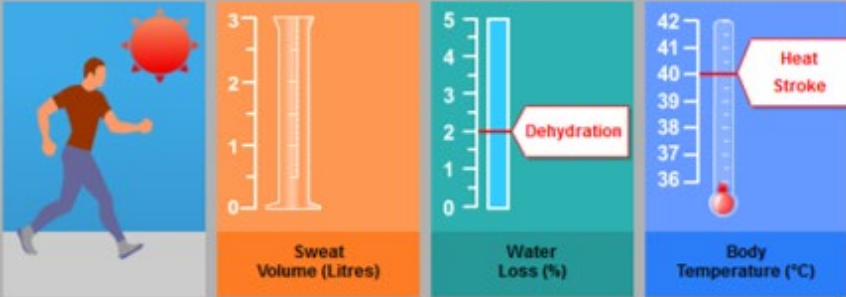

Introduction

This simulation is based on a model that calculates the volume of sweat, water loss, and body temperature of a runner after a one-hour run.

To see how all the controls in this simulation work, follow these steps:

1. Move the slider for **Air Temperature**.
2. Move the slider for **Air Humidity**.
3. Click on either "Yes" or "No" for **Drinking Water**.
4. Click on the "Run" button to see the results. Notice that a water loss of 2% and above causes dehydration, and that a body temperature of 40°C and above causes heat stroke. The results will also display in the table.

Note: The results shown in the simulation are based on a simplified mathematical model of how the body functions for a particular individual after running for one hour in different conditions.

The simulation interface features four main gauges: a runner icon, a 'Sweat Volume (Litres)' gauge (0-3), a 'Water Loss (%)' gauge (0-5) with a 'Dehydration' label at 2%, and a 'Body Temperature (°C)' gauge (36-42) with a 'Heat Stroke' label at 40°C. Below these are sliders for 'Air Temperature (°C)' (20-40) and 'Air Humidity (%)' (20-60), and a 'Drinking Water' radio button (Yes/No). A 'Run' button is also present.

Air Temperature (°C)	Air Humidity (%)	Drinking Water	Sweat Volume (Litres)	Water Loss (%)	Body Temperature (°C)

# Assessing in contexts and on screen: pitfalls

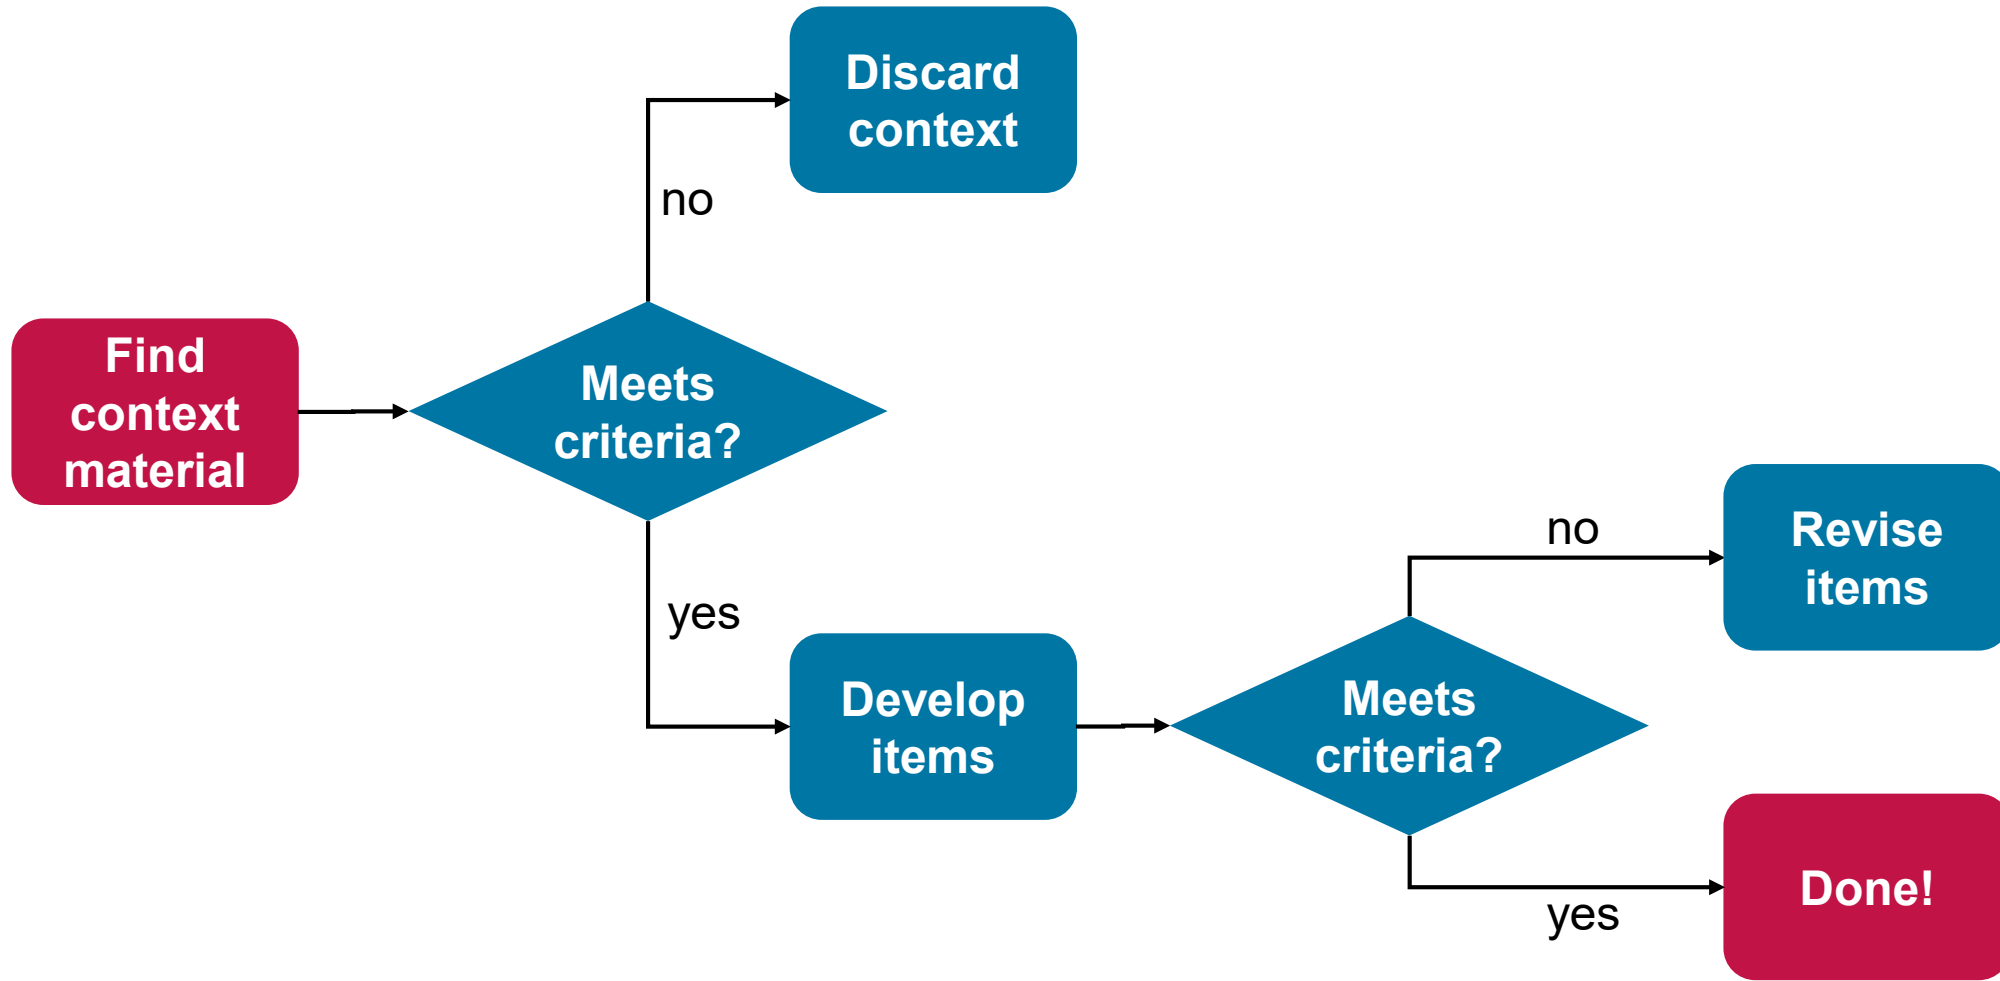

Keep in mind that it is **not the context** that is assessed but the **knowledge and skills** that are purposely related to that context!

→ Quality criteria : how to select good contexts for assessing HOTS?

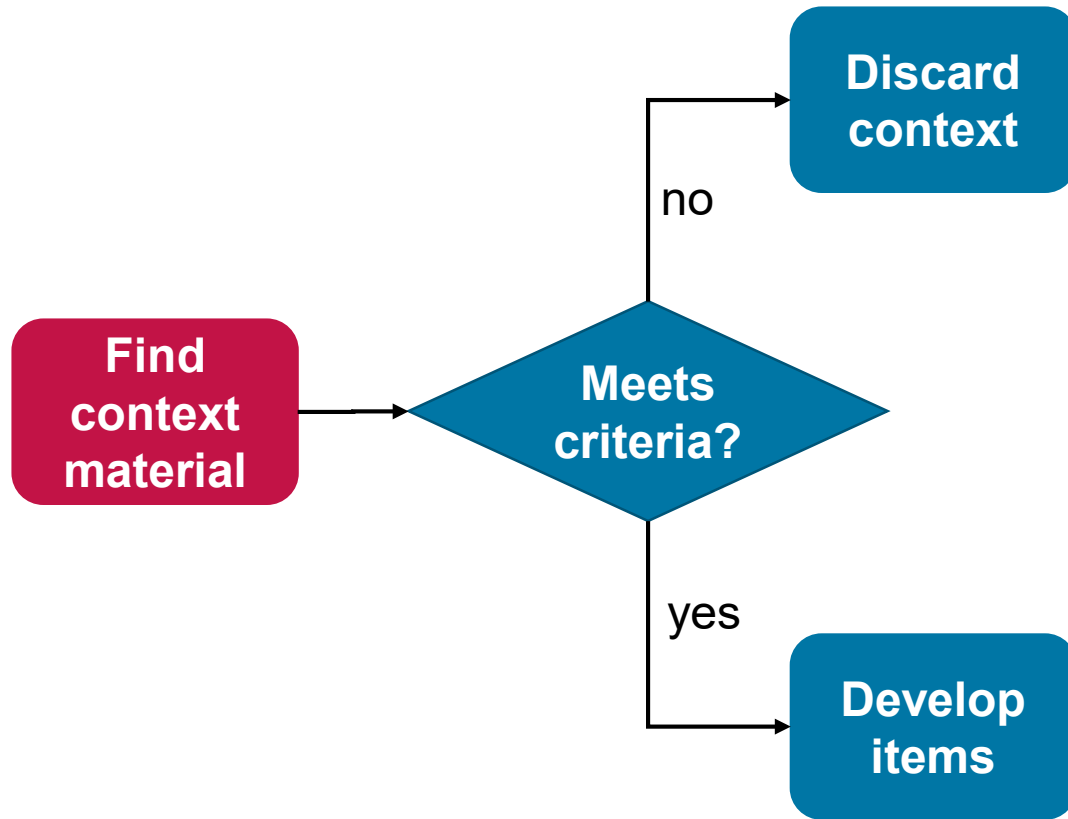

Keep in mind **not to assess IT-skills** but to assess the **knowledge and skills** that are intended!

→ Quality criteria : how to select good item types for assessing on screen?

# Item development assessment in context

# Categorising by scoring type & interaction

Parshall et al. focus on 7 types of item characteristics

dimension	Focus	example
Format	Item type	Select response, situated task, MPG
Complexity	Number of variables to consider in response	
Response action	Required manipulation for response	Click, drag and drop, write, draw
Media inclusion	Type of media	Written, visual, audio, simulation
Interactivity	Level of interactivity	
Scoring	How responses are scored	Automated, human
Fidelity	Authenticity	Task simulation

# Findings

## Scalise

was easy to use and new to many participants

## BUT

- There are intermediate (combined) item types
- Scalise is incomplete (it is 10 years old)
- The jump from 6 to 7 is “huge”
  - Many digital item types cannot be allocated

## AND

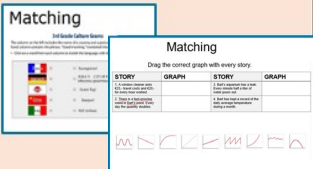

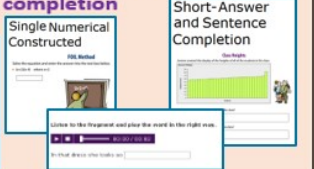

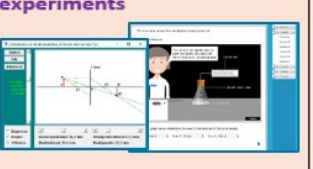

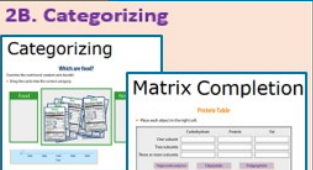

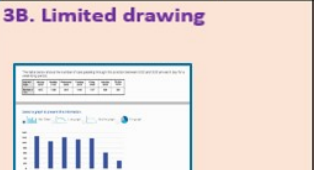

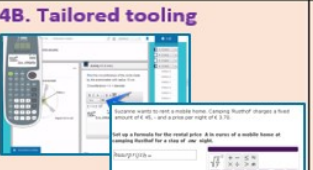

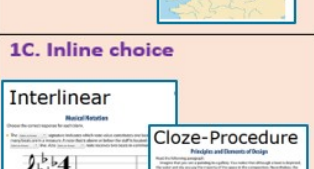

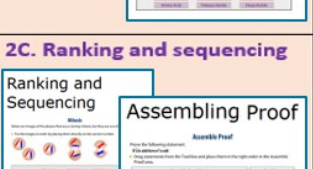

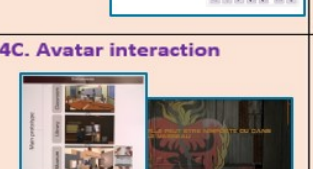

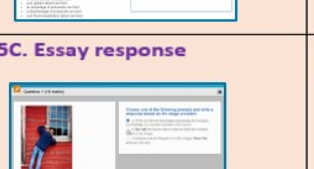

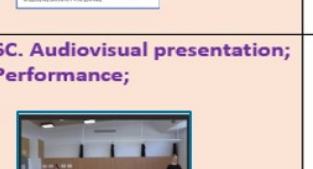

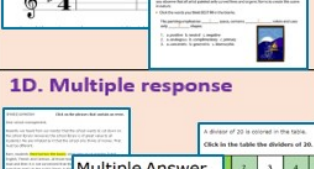

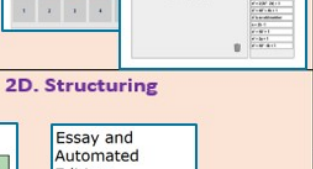

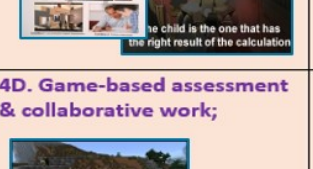

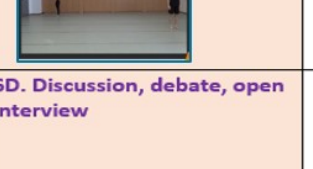

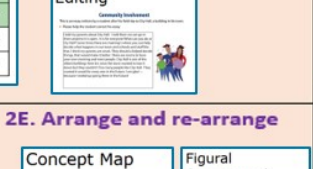

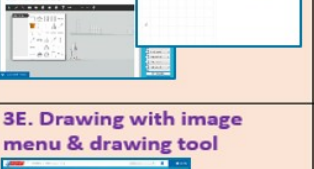

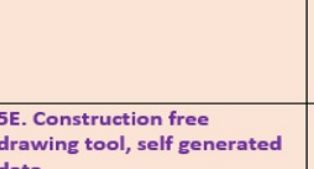

There is no connection to the assessment objective of the item

## *'Battle of the Seasons'*

In this work, I wanted to show the battle between Summer and Winter. The female dancer is summer and the male dancer is winter. They are both fighting to keep their weather in season.

At the **first section** of the dance the dancers do not connect. They move around the space in a circle as they prepare for the battle. You will see a pushing movement with a twist of the wrist; this is repeated to show the seasons tempting each other into battle. The dancers also do not look at each other often. This is to show they are angry and are not wanting to reason with each other.

In the **second section**, I have choreographed lots of partner work. This is to show the battle. I wanted the lifts and partner work to look like the seasons were in battle and fighting each other. I really tried to challenge myself with the lifts I created with my partner. I had to work hard on building my strength so that I was able to perform the movements safely.

The preparation to perform these two works is similar in many ways, however, there are some differences. The partner work 'Battle of the Seasons' is very intense and I have to ensure my mind and body are prepared, as my partner is relying on me.

# Future plans: validation of the framework

Expand with

- larger and more diverse set of items
- More experts

Check on

- Robustness
- Ease of use
- Aptitude as guideline for item development / assessment of HOTS.

Publish in peer-reviewed journal

**Interested? Do you want to help us improve the new framework of item types?**

How : Share items and/or engage in a classification task
